

AI17Z runtime notes

An agent is an identity, a memory, a model, a policy, and a set of channels it can act on. The runtime is generic: X, OpenRouter, a persona, and a reply are all configuration rather than special cases in the code.

Jobs advance through settled states, each committed before the next step starts, which is why a restart resumes rather than restarts.

A limit that has not cleared is not a failure. The retry-after from a gate goes to `waitForLimit`, which waits the stated time and charges no attempt.
